

14th EBEEC Conference 2022 - Florence

SPRINGER SPECIAL ISSUE

The Covid 19 pandemic has deeply affected health care systems around the world, highlighting their limits and contradictions.

The challenges faced at a global level have allowed the development of new ideas and new projects linked to the rethinking of health services and service management models. In this perspective we can expect a future of significant reforms.

The need of strengthening health and welfare systems is felt especially in the countries of the Balkans and Eastern Europe, where the pandemic has accelerated the transformation process. The rethinking of organisations is accompanied by the huge resources, made available by the EU for the post-pandemic development. It is an opportunity to fill the existing gaps in the infrastructures devoted to the provision to the health services and imagine health care reforms as driver of country's development.

This special issue will welcome papers on all of the above topics and others relating to the role that Economic and Management Science can play in supporting healthcare reforms with particular reference to the Balkan and Eastern European countries.

We encourage the submission of manuscripts that focus on, but are not limited, to the following topics:

- Best and new practices for delivering healthcare services
- Healthcare innovation through digitalization and information technologies (telemedicine)
- Process and Product innovation in healthcare
- New healthcare governance after Covid-19
- Collaborative experiences and networks in healthcare during Covid-19
- Innovation and transformation in financing healthcare services
- Healthcare Management during and after the pandemic disease
- Healthcare Policy Innovation during and after the pandemic disease
- Changing and evolution of global and public health
